

the guide coat process has been revolutionised...

CAM Purple Haze acts as a dye and penetrates the surface of primer coats after one thin application, highlighting even the finest imperfection, speeding up the sanding process prior to top coating!

“We have been using Purple Haze for 6 months now and find the product far superior to the GMH Black that we previously used. Purple Haze shows every imperfection in the primer coats, which in turn speeds up our sanding process. Paper clogging is not apparent when compared to GMH Black and Purple Haze highlights bodyfiller repairs by a darkened shade over these areas.

Not only is it economical, but it is easy to use. CAM is on a winner with Purple Haze!”
